The present invention relates to a new jAZF1 (juxtaposed with another zinc finger), jjAZ1 (joined with jAZF1) or jAZF1/jjAZ1 polypeptide. The methods of the invention can be used to identify a compound which controls proliferation of endometrial stroma, by expressing jjAZ in the presence of the compound, and determining whether the compound affects expression of jjAZ. jAZF1, jjAZ1 or jAZF1/jjAZ1 polypeptides are useful as immunogens or antigens to raise or test anti-jAZF1, jjAZ1 are useful jAZF1/jjAZ1 antibodies. The invention can be used as bait proteins in a two hybrid assay or three hybrid assay to identify other proteins which bind or interact with jAZF1/jjAZ1-binding proteins. jAZF1, jjAZ1 or jAZF1/jjAZ1 molecules are useful for identifying the origin of tumour as tumour marker protein to verify that a stromal tumour is from endometrium. The antibody is useful for promoting or decreasing fertility
                                                                                                                                                                                Human; jAZF1; juxtaposed with another zinc finger; jjAZ1; jAZF1/jjAZ1; joined with jAZF1; proliferation; endometrial stroma tumour; immunogen; antigen; antibody; fertility; pregnancy; gene therapy; vaccine; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             or pregnancy, and also for treating endometrial stromal tumours. The present nucleic acid sequence represents a PCR primer that was used in the methods of the invention for amplification of the human jAZFI gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel jAZF1, jjAZ1 or jAZF1/jjAZ1 polypeptides useful as immunogens or antigens to raise or test anti-jAZF1, jjAZ1 or jAZF1/jjAZ1 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 20;

AAV9721 to AAV96043 and AAV9899 to AAV99090 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98866 and AAV98867 to V9978 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGP-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for

```
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl clear an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17661 to AAA1762 to AAA19154 to AAA17660 and AAA17681 to AAA19155 and AAA19155 to AAA19157 and AAA19155 to AAA19157 to AAA1923 to AAA21681 represent their corresponding target sequences; AAA1688 represent their corresponding target sequences; AAA1689 to AAA21675 and AAA21675 to AAA21676 to AAA21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving the an integrin subunit beta 3 gene, an integrin subunit beta 3 dend AAA1768 to AAA1985 to AAA1985 to AAA1987 to AAA1918 to AAA218 to AAA1923 to AAA2189 to AAA2188 represent their corresponding target sequences; AAA2168 to AAA2168 represent their corresponding target sequences of the invention are used for modulating the synthesis, expression and/or the invention are used for modulating the synthesis, expression and/or their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or integrin subunit beta 3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabeter retinopathy, age related macular degeneration (ARW), inflamation, and arthritis as well as necowascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, candidorme, Kippel-Trenaumay-Weber syndrome, Obler-Weber-Rendu syndrome, syndrome, subunit alpha-6, or integrin subunit beta-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                    Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; anglogenic factor; cytostatic; antidiabetic;

and Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, central nervous system injury.

Claim 30; Page 155; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down correspondence expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule DNAZyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA cof CD20 in the presence of a divalent cation that is preferably Mg^2+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma immunodeficiency virus) associated NHI, lymphoma, with limphoma immunodeficiency virus) associated NHI, lymphoma, leukaemia, HU (human immunodeficiency virus) associated NHI, manthe-cell lymphoma (MCI), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunodefic acid and interest a divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the condescence of a divalent cation that is preferably Mg^2+. Furthermore therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the condescence of a divalent camping a condition associated with the level of NoGO. The treatment may further comprise the use of one or more corrected therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO-treated to treat central nervous system (CNS) injury and cerebrovascular accident (CNA),

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP

and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polynuclectide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pct_sequence

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-10 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify mucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1. Proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describio nonisation, as the proteins of hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart of the chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ·.
                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents an oligomer used in the screening of the headDMLP.1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 127; 149pp; English.

The invention relates to a nucleic acid molecule (1) which down regulates expression of an Ets-related gene (ERG). (1) is useful for treating conditions selected from cancer, lymphoma, Ewing's saccome, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, uniquaris, augiogenesis, diabetic retinopathy, macular degeneration, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing. (1) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (1) under conditions suitable for the treatment. The method comprises the use of one or more therapies to under conditions suitable for the treatment. Euchaemia or tumour angiogenesis is treated by administering (1) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cellong the cell with (1). (1) is useful for cleaving RNA of ERG gene, by contacting the cell with (1). (1) is useful for cleaving RNA of ERG gene, by contacting (1) with RNA, in the presence of a divalent cells of the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (1) is useful for specifically trageting genes that share homology with ERG gene or ERG fusion genes. ABKI7354-ABK22719 represent nucleic acids, including antisense and cenymatric nucleic acid melecules which regulate expression of ERG, and enzymatric nucleic acid melecules which regulate expression of ERG, and related PCR primers of the invention

New isolated nucleic acid, useful for treating viral diseases associated

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that other sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the mucleic acids, component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the mucleic acids, cells containing the corporation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are polypeptides can also be used to generate antibodies, and components and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression corporation chips. with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells. Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 35; 72pp; English.

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or cervical, necknam antibodies, REL-A-specific inhibitors or cyclophosphanide, doxorubin, flucrouracil carboplatin, methotrexate, gemeitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as theumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple solerosis, transplant/graft rejection, gene therapy applications, ischemial/reperfusion injury (central nervous system (CMS) and myocardial), glomerulonephritis, sessis, allegis, allegis, allegis, inflammation, inflammatory bowel disease or services or sepsis, allegis allegis, inflammatory bowel disease or services or sepsis, allegis allegis or services. The invention describes an enzymatic nucleic acid molecule (I) which down infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

                                                                                                                                                                                                                                                                                   The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acid are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            d
                                                                                                                                                                                                                                                                                                                                                                                                the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HEV) RNA. The mucleic acid molecules include antisense and enzymet, amberzymes, authorized ribozymes. NRAzymes, inozymes, zinzymes, amberzymes, and g-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as wells as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

AAV02716-V02738 are hybridisation probes used in a novel method for testing tissue samples to determine the allelic type of a human leukocyte antigen (HLA) class I gene in the sample. The HLA Class I gene is selected from among HLA-A, -B and -C genes. The method comprises of treating the tissue sample to obtain nucleic acid polymers suitable for amplification then combining these polymers with a first primer which hybridises with a portion of intron I or intron 3 of the HLA Class I gene and a second primer which hybridises with a different portion of the HLA class I gene under conditions suitable for amplification to obtain an amplified product. The product is then evaluated to determine the allelic type of the HLA-Class I gene. The method is useful for tissue matching HLA class I antigens between donors and recipients and hence for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA-based human leukocyte antigen class I gene typing method - useful for tissue matching and prevention of graft versus host disease.

to isolate and analyse the HLA genes

DB 1; Length 18;

HIA class I gene. The method is useful for testing a tissue sample to determine the allelic type of a classical or non-classical HIA class I gene in the sample. The sequences AAA11039-A11122 represent consensus sequences of introns and exons of the HIA genes and primers and probes

Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

Human chromosome 1p36-35 PCR primer SEQ ID NO:1005.

The present invention provides the protein and coding sequences of leptin fragments which modulate the activity of lipolysis stimulated factor (LSR). These sequences are useful in the treatment of obesity related

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates; (b) a primer designed based on the chromosome marker comultiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having and marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified confinitivell plates of the specified and the confinitation Nos. are maxed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the central directions; (f) the mixed clones are cultured and the constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABM-4297 to ABM-4532 represent PCR primers for human chromosome 21q22.1, which are Expresent crepresent present processing the present invention continued in the present invention

```
mutant alleles of which cause a susceptibility to insulin-dependent diabetes mellitus (IDDM, type 1 diabetes). The AGT gene is located on chromosome 142-43, a region linked to IDDM. The invention discloses genomic sequences comprising exons 1-5 of the human AGT gene (AAC91600-CC GAMC9160). The invention also encompasses the specifically claimed human AGT gene exon 1 (AAC91606). The invention also encompasses the specifically claimed human AGT gene exon 1 (AAC91606). The invention also encompasses the specifically claimed human AGT mutant nucleic acid sequences AAC9166-C91684, and the mutant AGT alleles or gene products thereof which are related angiotensingen proteins AAB8945-B48949. The invention also relates to detecting mutant AGT alleles or gene products thereof which are related to IDDM, determining whether a person has, or is at risk of developing diabetes via detection of a polymorphism in the AGT gene; and methods of screening for drug candidates which may be useful in the treatment of diabetes resulting from an AGT mutation. Methods of preventing of a compound which agonises or antagonises wild-type or mutant AGT, which compasses a transgenic non-human animal, or cell line derived compound which claves AGT receptors, which inhibits AGT, which cerompasses a transgenic non-human animal, or cell line derived computed in the AGT gene are useful for determining if a person has, or is at risk from developing insulin-dependent diabetes mellitus. AGT con first thereof are useful for screening compounds which bind to AGT gene exon 2 pcR polymorphises. The present sequence represents a human AGT gene exon 2 pcR primer used in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                          Novel angiotensinogen gene, mutant alleles of which causes susceptibility to insulin-dependent diabetes mellitus useful for diagnosis of predisposition to diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the human angiotensinogen (AGT) gene, some

```
mutant alleles of which causes a succeptibility to insulin-dependent diabetes mellitus (IDDM, type 1 diabetes). The AGT gene is located on chromosome 142-43, a region linked to IDDM. The invention discloses genomic sequences comprising an alternative AGT gene (AAC91600-CO 16AC9160). The invention also encompasses the specifically claimed human AGT mutant nucleic acid sequences AC9166-CO1684, and the mutant AGT mutant and ralleles or gene products thereof which are related to IDDM, determining whether a person has, or is at risk of developing diabetes via detection of a polymorphism in the AGT gene; and methods of screening for arm and AGT mutation. Methods of preventing of diabetes resulting from an AGT mutation. Methods of preventing of a compound which agonises or antagonises which the definition of a compound which agonises or antagonises which the inhibits AGT gene compound which agonises or antagonises which which inhibits AGT gene expression, or which cleaves AGT proteins. In addition, the invention compounds a transgenic non-human animal, or cell line derived encompassion, or which cleaves AGT proteins. In addition, the invention therefrom, comprising a mutant human AGT allele called person has, or is at risk from developing insulin-dependent diabetes mellitus. AGT can be used to treat a person has, or an art and a mutant human AGT allele. The polymorphisms is at trisk from developing insulin-dependent diabetes mellitus. AGT means or manimal, or cell line agonisms or is at trisk from the AGT gene are useful for determining if a person has, or manimal to mutant human AGT means or manimal to mutant and the addition when the addition and the addition and appropriate and the addition and appropriate and a mutant human AGT allele. The polymorphisms is at trisk from the AGT gene are useful for determining if a person has, or manimal to a succession and an addition and appropriate and appropriate and appropriate and appropriate and addition and appropriate and appropriate and appropriate and addition and approp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel angiotensinogen gene, mutant alleles of which causes susceptibility to insulin-dependent diabetes mellitus useful for diagnosis of predisposition to diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              modulators can be used to treat or prevent diabetes. Mutant AGT proteins or fragments thereof are useful for screening compounds which bind to AGT polypeptides. The present sequence represents a human AGT gene exon 2 PCR primer used in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the human angiotensinogen (AGT) gene, some
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.6%; Score 13.8; DB 1; Length 19; larity 88.2%; Pred. IGFBP3 oligonucleotide #1363. 

Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor 1 receptor; IGF-1; pityriasis;

IGF binding protein; IGFBP-2; IGFBB3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition; hyperplasia; kidney disease; Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or Edmondson SR (MURD-) MURDOCH CHILDRENS RES INST. 21-JUN-2000; 2000WO-AU000693. 99US-0140345P Werther GA, WPI; 2001-041421/05. WO200078341-A1. 21-JUN-1999; inflammation. Homo sapiens Wraight CJ, 

skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ineoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood present invention relates to a method for ameliorating the effects of vessels or any other hyperplasia

attisense oligomucleotide, (for Insulin-like Growth Ractor [IGF]-1
receptor, IGF binding protein [IGFBP] - 2 or IGFBPB), which is capable of
inflammation and/or other disorders. The present sequence is an
inflammation and/or other disorders. The present sequence is an
oligomucleotide which can be used to design the antisense
oligomucleotides of the present invention (see AAFA5153 and AAF45153 -
eligomucleotides of the present invention (see AAFA5153 and AAF45153 -
thyposis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis,
chthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis,
neoplasias, scleroderma, warts, benign growths, cancers of the skin, a
hopman or skin, growth factor-mediated malignandies, other sclerotic
disease, kidney disease, hyperproliferation of the inside of blood
vessels or any other hyperplasia
                                                                                                                                                                                                                         Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                          present invention relates to a method for ameliorating the effects of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bovine DGAT1 cDNA polymorphic variant specific probe, Dgatless66 (VIC).

The invention relates to a method of genotyping bovine for improved milk production traits which comprises determining the diacylglycerol acyltransferase (DGAT1) genotypic state of the bovine, wherein the DGAT1 genotypic state of the bovine, wherein the DGAT1 genotypic state. It is also useful for the DGAT1 improved milk production traits. The method is useful for selecting a bovine having a desired DGAT1 genotypic state. It is also useful for the identification and selection of a bovine having one of the polymorphisms in its DGAT1 gene. Milk produced from selected bovine which is useful for making a dairy product provides a beneficial health effect. An antibody to the protein having DGAT1 activity is useful for inhibiting the cotting production and/or milk solids content. DGAT1 uncleic acid and its fragments are useful in the farming industry. They are also useful to generate transgenic animals which are useful to investigate the molecular basis of DGAT1 activity. They are also useful content activity to prevent, slow or enhance DGAT1 activity. They present sequence is bovine DGAT1 to bny content of the prevent sequence is bovine DGAT1 to bny content of the prevent sequence is bovine DGAT1 to bny content.
                                                                                                                                                                                                                                                                                                                                                                                                        Determining genetic merit of a bovine with respect to milk composition and volume for improved milk production, comprises determining the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Type B ammonia-oxidising bacterium 16S rRNA gene reverse PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                           and volume for improved milk production, comprises determining the diacylglycerol acyltransferase gene genotypic state of the bovine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Type B; ammonia-oxidising bacterium; AOB; nitrite; 168 rRNA gene; ribosomal RNA; aquarium; aquaculture; waste water treatment;

The invention relates to 4 novel types of ammonia-oxidising bacteria

(ADB) found in freshwater aquaria. The bacteria are able to oxidise

ammonia to nitrite and are members of the ammonia-oxidising bacteria

family of the beta subdivision of Proteobacteria. The 4 types of bacteria

can de distinguished on the basis of their 165 rRNA (ribosomal RNA) gene

sequences (ABARO2416-ABARO2416), and are classified as ABB type A (e.g.,

R7clone140), type A1 (e.g., R7clone187), type B (e.g., R3clone5) and type

(e.g., R3clone47). The invention also encompasses isolated 165 rRNA

gene sequences of the ammonia-oxidishing bacteria of the invention,

oligonucleotide probes and primers for the detection of these bacteria,

and compositions comprising the bacteria. The bacteria of the invention

are useful in biological filters for reducing ammonia accumulation in

both freshwater and seawater aquaria. They may also be used in waste

water treatment and in bioremediation processes to reduce the level of

pollution caused by ammonia. Sequences ABA02424 ABA02425 represent PCR

pulmers for the detection of the 165 rRNA gene sequence of the type B

ammonia-oxidising bacterium (ABA02418). (Updated on 29-AUG-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ·

```
The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin; granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ribozyme; erythropoietin; granulocyte colony stimulating factor;
                                                                                                                                                                                                    .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;
                                                                                                                                                                      The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention is concerned with a number of human single nuclectide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 131; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGCD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a possessing an NCH motif), a G-cleaver (cleaving an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule opessessing an NCH motif), a G-cleaver (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with an NGN triplet) a zinzyme (cleaving RNA with an NGN triplet) a zinzyme (cleaving RNA with an NGN triplet) a call to reduce CD20 eave RNA corrected with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic lymphoma, leukaemia, HIV (human immunoceficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphocytic lymphoma, immunocytoma (IMC) small B-cell lymphocytic lymphocytic lymphocytic lymphocytic lymphoma, immunocytoma (IMC

```
·,
therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, miscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is an amberzyme molecule of the invention
                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                         ;

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, cretinoblastoma, BRCAL, BRCAL, CFTR, CYClin-dependent Kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apoliopprotein E (APOB), LD receptor (LDLR), UD-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSBN1) and presentlin-2 (PSBN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, chaemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and correcting colons. Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical Gaps Retinoblastoma mutation correcting oligonucleotide SEQ ID NO: 559. 713/c ABA77713 standard; DNA; 17 BP. 967 3 rerarcecracaac 17 24-JAN-2002 (first entry) 953 TGTATCGCTACCAAC ABA77713; RESULT 309 ABA77713/ 쉼 à

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                             be used for the targeted alteration of genomic sequences, where the oligomoleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCAL, BRCAL, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Pactor V, Factor IVII, Factor IX, haemoglobin alpha locus 1 (HBA2), MEH, MSH2, MSH2, MSH6, amploid precursor protein (APC), presentlin-1 (PSENI) and presentlin-2 (PSENI). IDF receptor (LDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APC), presentlin-1 (PSENI) and presentlin-2 (PSENI). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and parious syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                             The present invention provides single-stranded oligonucleotides which can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                                                                             Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 modeler acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser description jonisation, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymorleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP-proteins, as specific biomolecule and/or amount specifically of hGDMLP-proteins, as specific biomolecule captures probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and skeleral muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeleral muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed contractory with the same of the present invention of the present directly from MIPO process of the present did not form part of the present directly from MIPO process of the present did not form part of the present directly from MIPO process of the present did not form part of the present directly from MIPO process of the present did not form part of the present directly from MIPO process of the present direc ftp.wipo.int/pub/published\_pct\_sequence

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 93; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates corpression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer. lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, maculat degeneration, cumour angiogenesis, diabetic retinopathy, maculat degeneration, or unevascular glaucoma, wyopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge weber syndrome, leukaemia, osceoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies the treatment. The method comprises the use of one or more therapies conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with an so of 10 is useful for reducing ERG activity in a cell, by contacting (I) with RNA, in the presence of a divalent of diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for succeiving conditions and cargeting genes that share homology with ERG gene or ERG fusion genes and cargeting genes that share homology with ERG gene or ERG fusion genes.

Chargeting genes that share homology with regulate expression of ERG, and and engage or engymatic nucleic acide, including antisense and engage or engymatic nucleic acide, including antisense and engagement of the presence of ERG RNA including antisense and engagement and engagement accor related PCR primers of the invention

The invention relates to a novel isolated 17 mer nucleic acid sequence,

given in the specification, a sequence containing at least 15 consecutive

uncleotides from the 17 mer sequence, a sequence with, after optimal

alignment, at least 80 % identity to the 17 mer sequence that

alignment, at least 80 % identity to the 17 mer sequence that

the corresponding NAN. The novel isolated nucleic

of any of them, or the corresponding NAN. The novel isolated nucleic

of any of them, or the corresponding NAN. The novel isolated nucleic

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive connected of time the 17 mer sequence with, after optimal and alignment, at least 80 % identify to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic cida of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, copputation of recombinant polypeptides. Any of the nucleic acids, certor or antibodies directed against the polypeptides are useful for vector or antibodies directed against the polypeptides are useful for creament of parameterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and copputation specifically cancer but also Alzheimer's disease and copputation and antibodies; and/or prognosis of these contains and properties can also be used to generate antibodies, and chipse the nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression correlated human fukutin oligonucleotide of the invention
                                                                                                                                          Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive mucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that lybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic cidantifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, concern or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are polypeptides for prevention of reatment of viral containing the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chizophrenia. The polypeptides and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression crelated human fukutin oligomucleotide of the invention
                                                                                                                                                                                                                                                                             Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                Tumour suppression related human fukutin oligo SEQ ID No 3162.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Seguence 17 BP; 4 A; 3 C; 6 G; 4 T; 0 U; 0 Other;

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, indzymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptemers that bind to HBV reverse transcriptase primer sequences, as well as Oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and expression such as cirrhosis, liver failure, and hepatocellular carcinome. The present sequence represents a substrate for one of the HBV carcinome. The present sequence represents a substrate for one of the HBV carcinome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, include antisense are nucleic acids such as hammerhead ribozymes, DNAzymes, transcriptese, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptese primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;

```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing the vectors), the encoded polypeptides and antibodies (b) against the polypeptide are useful for prevention and/or treatment of fruze infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and be used to screen for their specific interestive molecules, correspondent of the nucleotides. The nucleotides associated with abnormal expression of the nucleotides associated with abnormal
                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cytostatic, antiviral, neuroprotective, nootropic, neuroleptic, ss;

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, are the complement, or corresponding RNA, of the nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour sepression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
Analysis of the expression of the nucleotides can be used for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New mucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, incymes, zinzymes, amberzymes, and G-cleaver ribozymes. BNAzymes, and re nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonacleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

This sequence represents a probe for the RT pol region of hepatitis b virus (HHV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HHV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polymucleic acids (1) in the sample, and amplifying the concentrating polymucleic acids (1) in the sample with at least 1 concentrating polymucleic acids (1) in the sample with at least 1 concentrating probes, which are applied to known locations on a solid 2 nucleotide probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from the HHV genotype sadors metants, or their complements or U for T concologues; (c) detecting the hybrids formed in step (b), and inferring the HHV genotype and/or mutants present in the sample from the confidence and/or mutants present in the sample from the call hybridisation signal (s). The composition can be used to diagnose and/or monitor HHV mutants and/or genotypes in a sample, specifically genotype, precore mutations, vaccine escape mutations and RT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Probe; hepatitis b virus; HBV detection; RT pol region; genetic analysis; preCore region; HBsAg region; genotype specific target; mutation detection; ss.
that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inczyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection and/or genetic analysis of hepatitis B virus - specifically genotype, precore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs.

This sequence represents a probe for the RT pol region of hepatitis b virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B Virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (I) in the sample, and amplifying the concentrating polynucleic acids (I) in the sample, and amplifying the concentrating polynucleic acids (I) in the sample, and amplifying the concentrating probes, which are applied to known locations on a solid support and hybridise specifically to mucant target sequences chosen from the HBV RT pol gene region, HBV precore region, HBAB region and/or HBV genotype specific target sequences, or their complements or U for T che HBV genotype and/or mutants present in the sample from the differential hybridisation signal(s). The composition can be used to differential hybridisation signal(s). The composition can be used to dispose and/or mutants and/or genotypes in a sample,
                                                                                                                             0;

```
This sequence represents a probe for the RT pol region of hepatitis b virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (1) in the sample, and amplifying the celevant part of a suitable HBV gene in the sample, and amplifying the suitable primer pair; (b) hybridise in (1) with a combination of at least c suitable primer pair; (b) hybridise specifically to mutant target sequence on a solid c support and hybridise specifically to mutant target sequences chosen from the HBV RT pol gene region, HBV precore region, HBSAg region and/or HBV conceptual; (b), and inferring the HBV genotype and/or mutants present in the sample from the differential hybridisation signal(s). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, c specifically genotype, precore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs, eg. lamivudune and c pencilovir. (Updated on 27-AUG-2003 to correct OS field.)

This invention describes the detection of specific microorganisms from various taxa, in a sample containing several different microorganisms by nucleic acid hybridization, using as probes, 62 specific oligonucleotides (represented in AAX56765-X56826) with at least one oligonucleotide being able to hybridize to each microorganism. The method is useful for map be fully automated, allows simultaneous detection and unequivocal identification of bacteria from different taxa
                                                                                                                                                                     Microorganism; hybridisation; probe; identification; detection; bacteria;

invention, which contain a polymorphic base at position 24 of their invention, which contain a polymorphic base at position 24 of their nuclectide sequences. Azz65979 to Azz77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention bave a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies the human genome, and in complex association studies and haplotyping studies compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents acting as well as the characterisation of the differential efficacious responses to and side effects from that maceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and and also a sequence in the Sequence Listing from the
Novel biallelic markers used to construct a high density disequilibrium map of the human genome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides antisense compounds of 8-30 nucleotides that inhibit the expression of human Cellular Inhibitor of Apoptosis-1 (c-IAP-1). The antisense compounds may be used for diagnostics, therapeutics (for modulating the expression of c-IAP-1), prophylaxis (e.g. to prevent or delay infection, inflammation, or tumor formation), as research are generic (e.g. to distinguish between members of a biological pathway) and in kits. Sequences AAZ2215-189 represent phosphorothicate oligonucleotides used for antisense inhibition of cellular inhibitor of
                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense compounds complementary to Cellular Inhibitor of Apoptosis-1 useful for e.g. diagnostics, therapeutics, and as research reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0

                                                                                                                                                                                                                                                     and for prognosing, detecting and/or diagnosing cancers such as malignant astrocytoma, glibolastoma, medullobiastoma, gastric cancer, colorectal cancer, colorectal adenoma, acute myelogenous leukemia, lung cancer, renal cancer, leukaemia, breast cancer, prostate cancer, endometrial cancer, leukaemia, breast cancer, prostate cancer, endometrial cancer and neuroblastoma. Sequences ABZ75015-ABZ5038 repersent Mus musculus/Mus spretus STKL5 (STKG) probes and PCR primers used in expression and amplification analysis of STKL5 in an exemplification of
                                                                in a human patient. The method involves determining the identity of the nucleotide at position 457 of the serine/threonine kinase 15 (STK15) DNA (ABZ75065). This site is a T/A single nucleotide polymorphism (SNP) in the coding region of the DNA, resulting in either a Phe or Ile residue at position 31 in the corresponding STK15 protein (ABP97366). The A457 (Ile31) allele (see ABZ75006, ABP97367) is associated with an increased cancer susceptibility. STK15 (also known as STK6 and Aurora2) is a centrosome—associated kinase that is highly expressed at the G2 and M phase of the cell cycle, and its gene is located on chromosome 20. The method of the invention are useful for determining cancer susceptibility.
                                                  The invention relates to a method for determining cancer susceptibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mouse PDGFR-beta antisense oligonucleotide M-AS-PT-ODN SEQ ID NO:19.

The present invention describes nanoparticles (I) capable of delivery of an encapsulated molecule into a living cell, comprising an encapsulation an encapsulated molecule into a living cell, comprising an encapsulation media (EW) including a biodegradable polymer, and an isolated nucleic acid homologue sequence (II) encapsulated with EM, where the nanoparticles are capable of releasing (II) over an extended period of time. (I) have cytostatic and antimicrobial activities, and can be used in gene therapy. (I) can be used for sustained delivery and release of concleic acid homologue within a subject, by encapsulating a nucleic acid homologue within a subject, by encapsulating a nucleic acid homologue, by encapsulating an isolated nucleic acid homologue, by encapsulating an isolated nucleic acid homologue, by encapsulating an isolated nucleic acid homologue sequence designed to alleviate symptoms of the medical condition within EM, so that nanoparticles are formed, and delivery of nanoparticles into the subject, where the isolated nucleic acid homologue composition within EM, so that nanoparticles are formed, and delivering the condition within EM, so that nanoparticles are formed, and delivering condition within EM, so that nanoparticles are formed, and delivery condition within EM, so that nanoparticles are formed, and delivery effect and aberrant gene regulation. The nanoparticles are capable of composition composition composition on an exemple and into the cell very efficiently. The present condition composition condition the present invention are antisense oligonucleotide condition and example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  colon cell proliferative disorder; non methylated CpG dinucleotide; cytostatic; cancer; adenoma; carcinoma; cytosine methylation state; ss;
                                                                           Nanoparticles for sustained delivery of encapsulated molecule into a living cell, comprising encapsulation media with biodegradable polymer, and isolated nucleic acid homolog sequence encapsulated with medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hybridisation oligonucleotide 406 used to analyse genomic DNA region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lesche R;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0;

The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one gene or its regulatory regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or a series of reagents, where the reagent or series of reagents, where the reagent or series of invention demonstrate cytostatic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful for detecting and differentiating between colon cell proliferative disorders, including cancers such as colon adenoma and colon carcinoma. The PRM (peptide nucleic acid)-oligomers are useful as probes for determining cytosiem methylation state or single nuclectide polymorphisms. The current sequence is that of the hybridisation arcinomal and colon colligonuclectide of the invention which was used to analyse the genomic
                                                      Detecting and differentiating between colon cell proliferative disorders associated with a gene or its regulatory regions comprises contacting a target nucleic acid in a biological sample obtained from the subject with

                                                                                                                 The present invention relates to a method (M1) for determining a predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from UPA (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulindegrading enzyme), KNSII (Kinesin-like protein 1), LIPA (lysosomal acid lypase), and TNPRSF6 (Tumour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the
                                                                                                                                                                                                                                                                                 occurrence of neurodegenerative disease. The genes are all located on chromosome 10. MI is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly alzheimer's disease. The present sequence is a PCR primer, which was used in the method of the invention.
Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New sequence-specific non-photo-activated crosslinking agents - bind to the major groove of duplex DNA and are esp. useful for treating latent infections e.g. HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

isolation of various biallele-specific oligonuclectide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAXIOSEG-XI2397). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabeters insipidus, lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry, disease, familial hypercholesterolemia, polyostic Kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular
                           Oligomer Az-A was designed to associate specifically with a test cassette. It was found to covalently bind to guanine in the target sequence via the NAN4-ethanocytosine residue. Az-A was tested with a second oligomer (Az-B - see AAQ20003) and both were found to specifically recognise the appropriate cassette differing only in one nucleotide out
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymorphism, biallelic, human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their mucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention composition sund methods association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents methods, as well as the characterisation of the differential efficacious responses to and side effects from of the marmaceutical agents acting on a disease as well as other treatment. N. B. The SEQ ID NOS 2852, 2913, 2974, 3055, 3096, 3157, 3227, 3297 and 327, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel biallelic markers used to construct a high density disequilibrium
drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to Cryptosporidium parvum S60 potential vaccine antigen and its corresponding DNA molecule. S60 antigens are used in vaccine preparations for immunising animals, preferably human, against Cryptosporidium. The S60 protein is processed into two glycoproteins S15 and S45. This S45 and S15 glycoproteins behave as a single membrane glycoprotein S60. S60 vaccine antigen is used for treating intestinal infections such as diarrhoea in immunosuppressed patients e.g., AIDS (Acquired Immune Deficiency Syndrome), cancer patients and recipients of transplants. The present DNA sequence is PCR primer which is used for transplants.
                                                                                                                                                                                                                                                                                                                                                                        Novel nucleic acids encoding antigenic polypeptides of Cryptosporidium useful in antigenic preparations for immunizing animals against

This invention relates to a method for the detection of a microorganism in a sample. The method involves selecting a target DNA sequence in a target gene of a microorganism and detecting its presence in a sample using PCR amplification. The method is useful for detecting bacteria e.g. E.coli, E.faecalis/faecium in a liquid or liquefied sample by PCR. The present sequence represents a PCR primer used in the method of the invention for the detection of Escherichia coli. The primer is based on the sequence of the E. coli lambda receptor gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single nucleotide polymorphism; SNP; detection; Taqman; assay; quencher;
                                                                                                                                                                                                                                                                                                                                 Detecting microorganisms such as Escherichia coli, Enterococcus faecalis/faecium by PCR amplification of E.coli specific LamB gene and E.feacalis/faecium transposase gene Tn1546 using novel oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present sequence is that of single nucleotide polymorphism (SNP)

probe BAK/T. The probe has the rhodamine dye dTWR at its 5' end and

confirchiazole blue (FNE) at its 3' end. It was used in a multiple.

caspoint SNP analysis that demonstrated the use of novel non-fluorescent

asymmetric cyanide dye compounds of the invention (NTB in the present

case) as quenching reporter dyes. A 7-colour homogeneous detection of

multiple PCR products was performed as an extension of the fluorogenic

PCR 5'-nuclease, or Tagman, assay. The test system was a set of 3 SNPs,

PCR 5'-nuclease, or Tagman, assay. The test system was a set of 3 SNPs,

cannot be mPO, BAK and LIG. Each SNP system consisted of 2 primers (see

ABA91969-74) and 2 sequence-specific probes (see ABA91975-80), each

having NTB at the 3' end, and a different reporter dye (6-FAM, dR110,

cated with the sequence and a sequence spectrometer

caluminium phthalocyanine tetrasulfonate, used as a passive reference.

Pollowing PCR, the reactions were measured on a luminescence spectrometer

con synchronous scanning mode. The spectral overlap in the set was

caluminium phthalocyanine tetrasulfonate, used as a passive reference.

Construction of the conditioning number of the condition

caluminator (I.5) proved that crosscalk between the dyes was minimian.

Construction of the condition of the dyes was minimian.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 analyses of known, synthetic target DNA sequences (see ABA91981-90) and genomic DNA (from human blood samples and Raji (ATCC CCL-86) cells) were plotted as normalised, subtracted spectra and as data points in dot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             plots. The multiplex PCR system provides increased sample throughput and
                                                                                                                                                                                                                                                                                                                                           New non-fluorescent asymmetric cyanide dye compounds, useful for quenching reporter dyes in nucleic acid hybridization assays employing fluorescence energy transfer as means of detection.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intitation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antilniflammatory steroid and ubiquinone. A composition of the invention has antilniflammatory, antiallergic, antisathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cust in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in usual for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO cat fire, wipo.int/pub/published\_pot\_sequences Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or Pabalan J, Aguilar D; ; 0 Length 19; Indels Sequence 19 BP; 4 A; 7 C; 2 G; 6 T; 0 U; 0 Other; 0.6%; Score 13.4; DB 1; 13.3%; Pred. ```
The invention describes a new polynucleotide comprises a polynucleotide:

(a) having any of 101 nucleic acid sequences with 18-19 bp fully defined in the specification; (b) encoding any of seven polypeptides having 7 amino acids, or a polypeptide with 3 amino acids; (c) capable of hybridising to a Cytochrome P450 polypeptide 2C8 (CYP2C8) gene; (d) encoding a molecular CYP2C8 variant polypeptide or its fragment. The polynucleotide, gene, vector, polypeptide or antibody is useful for diagnosing a disease, for preparing a diagnostic composition for diagnosing a disease. This disease includes arachidonic acid metabolism, cancer or cardiovascular diseases. This sequence represents a primer used to isolate regions of the human cytochrome P450 polymerphism (SNP) in that region of different individuals useful in disease diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytochrome P450 polypeptide 2C8; CYP2C8; arachidonic acid metabolism; cancer; cardiovascular disease; cytostatic; cardiovascular; gene therapy; single nucleotide polymorphism detection; SNP detection; PCR; primer; ss.
                                                                                                                                                                                       New polymorphic variants of the gene encoding Cytochrome P450 polypeptide 2C8 (CYP2C8), useful for diagnosing or treating a disease, e.g. arachidonic acid metabolism, cancer or cardiovascular diseases.

The invention describes a new polynucleotide comprises a polynucleotide:

(a) having any of 101 nucleic acid sequences with 18-19 bp fully defined in the specification; (b) encoding any of seven polypeptides having 7 amino acids, or a polypeptide with 3 amino acids; (c) capable of care amino acids, or a polypeptide vit 3 amino acids; (d) capable of composition to a Cytochrome P450 polypeptide 2C8 (CYP2C8) gene; (d) chording a molecular CYP2C8 variant polypeptide or its fragment. The polymucleotide, gene, vector, polypeptide or antibody is useful for diagnosing or treating a disease, for preparing a pharmaceutical composition for diagnosing a disease. This disease includes arachidonic acid metabolism, cancer or cardiovascular diseases. This sequence represents a primer used to isolate regions of the human cytochrome P450 polypetide cancer or expression of the human cytochrome P450 polypetide cancer or expression of different individuals useful in disease diagnosis ö New polymorphic variants of the gene encoding Cytochrome P450 polypeptide 2C8 (CYP2C8), useful for diagnosing or treating a disease, e.g. arachidonic acid metabolism, cancer or cardiovascular diseases. New oligonucleotides, useful for detecting bacteria that may contaminate drinking water, provide quick results for many species in parallel. This invention describes novel oligonucleotide probes used to detect contaminant bacteria that may be present in drinking water. The probes can detect bacteria (especially Legionella, faecal streptococci and coliforms) that may contaminate drinking water in environmental samples Detection, probe; contaminant; drinking water; Legionella; coliform; faecal streptococci; soil; sputum; biopsy; urine; food; pharmaceutical; cosmetic; fluorescent in situ hybridisation; FISH; ss. bathing and drinking water and in foods, pharmaceuticals and cosmetics, by in situ hybridisation. The probes combine the advantages of fluorescent in situ hybridisation with those of culture methods. Only a relatively short culture step is required; analysis takes 24-48 hours (contrast many days for conventional methods) and all relevant bacteria between species of the same genus and are easy to use, allowing simple analysis of a large number of samples. ABX94532-ABX94578 represent the oligonucleotide probes described in the invention
                                                                                                                                                                                                                                                                                      Sequence 19 BP; 1 A; 6 C; 5 G; 7 T; 0 U; 0 Other;

Human hRAD54 DNA and polypeptide - and agonists, antibodies, antagonists,

Claim 18; Page 49; 64pp; English.

The present sequence represents a PCR primer for use in a method of the invention for determining the genetic predisposition to cancer in an individual by detecting PRAD54 mituations in a sample. PRAD54 is a gene thought to be present in tumours that display allelic imbalance at 1p32, the chromosomal band identified as one of four minimal regions of chromosome I deletion in breast carcinomas. PRAD54 is useful for production of proteins, inter alia, that have been identified as novel hRAD54 by homology between the amino acid sequence given in AAW62186 and known amino acid sequences such as yeast RAD54. PRAD54 proteins are used in the treatment of cancer, including Meroderma Pigmentosum and Bloom syndromes and X-linked mental retardation with alphathalassaemia syndrome and breast cancer. hRAD54 polynucleotides are also useful for detecting complementary nucleotides for use as a diagnostic

agent, especially useful for diagnosis of disease or susceptibility to diseases. hRAD54 polynuclectide, proteins, agonists and antagonists which are proteins are useful in gene therapy 888888

Ë, Vider WPI; 1999-419113/35.

Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.

Claim 4; Page 30; 102pp; English.

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the an individual, e.g. a fetus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAL1803-21342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be eslected from a set of homeobox genes, that segmes, expression. protein phosphatase genes, P450 enzyme genes, steroid receptor superfamily genes or cadherin superfamily genes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and as ascond cell comprises: (a) obtaining the first cell and the second cell comprises: (a) obtaining the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a copy proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its constitution of a cell, its genetic status, whether it carries a genetic defect, or whether it is carnies a genetic defect, or whether it is can individual, e.g. a fetus. They can also be used for detecting a selected genetic defect in a nidividual, e.g. a fetus. They can also be used for determining the cobtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-ECR) for determining the pattern of gene expression in a selected con the Rmily. Sequences AAL17801-218342 represent primers that can be used in the RT-ECR reactions to determine the pattern of gene expression. The content in phosphatase genes, AAL17801-218342 represent primers that can be used con the method are pattern of gene expression. The content in phosphatase genes, steroid receptor and any account of the content of the content
                                                                     ;
                                                                                                                                                                                                                                                                                                                                                                     Genetic proximity; gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR; kinase gene; protein phosphatase; P450; steroid receptor; cadherin;

```
This sequence represents a human chromosome alpha-satellite region. The invention relates to the use of a triple-helix forming oligomucleotide for in situ detection of a double-stranded target mucleic acid sequence. The method can be used to detect a genetic disorder e.g. to detect an extra or missing chromosome or fragment or aneuploidy, especially for detecting an extra or missing chromosome 17 or 21. The method can be also be used to screen for individuals at risk of developing a disease or for diagnosing an infectious disease. The use of triple helix forming oligomucleotides allows in situ detection of double stranded target sequence as opposed to prior art uses of developing potential anti-gene therapeutic agents or artificial restriction endonucleases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel use of triple helix forming oligonucleotides, useful for in situ detection of double stranded target sequence.

```
the expression of a target nucleic acid (tNA) sequence via binding of the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of a cefining a set of oligomoleotides (ONS that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation of such compounds with the tNA. The methods can be used for the generation creating a used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are artisense drug discovery and target validation. A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a compound silico compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of defined criteria. Also described are: (1) a method of a cording to defined criteria, and esquence via binding of the owns with the tNA sequence comprising a tNA sequence via binding of the owns with the tNA sequence comprising concerning a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual one with the tNA according to defined criteria, and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation of the compounds is used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are compounds is used to identify nucleic acid sequences that are compounds availety of mudiacidies education.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel human antigenic protein, HMI.24, its encoding nucleic acid, splice variants and promoter region. The products of the invention have antirheumatic and antiarthritic acclivity. The DNA of the invention is isolated from bone marrow tumour cells, which can be used to study the expression of HMI.24 antigen, promoter activity of its promoter region, and in development of drugs in treating e.g. myeloma and rheumatoid arthritis. AAZ09744-Z09754 represent primers used in the amplification and isolation of the human HMI.24 antigenic protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        encoding HM1.24 antigen protein as well as splicing variants, in development of drugs for treating myeloma and rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human BLK-1; p62TCF; Ets domain transcription factor protein; apoptosis; expression inhibition; inflammation; tumour formation; diagnosis; phosphorothioate; antisense compound; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= b

nucleic acid molecule encoding human ELK-1 (also known as p62TCE). ELK-1 is a member of the ternary complex factor subfamily of Ets-domain transcription factor proteins. The polynucleotides inhibit the expression of human ELK-1, and this sequence targets the coding region of the ELK-1 RNA. Sequences AAZOG571-206607 all cause at least 30% inhibition of ELK-1 CANA. Sequences AAZOG571-206607 all cause at least 30% inhibition of ELK-1 CANA. Sequences and be used to inhibit the expression of human ELK-1 in human cells or tissues in vitro. ELK-1 uses a bipartite recognition mechanism mediated by both protein-DNA and protein-protein interactions to regulate genes by direct and indirect DNA binding and has been shown to control various signal transduction pathways and other cell functions including apoptosis. This means that antisense compounds inhibiting expression of ELK-1 can be used to treat diseases associated with its expression in animals, particularly humans and to prevent or delay infection, inflammation or tumour formation. The compounds can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
/note= "Optionally 2-methoxyethyl (2'-MOE) nucleosides except cytosine residues which are 5-methylcytosine"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAZ06571-Z06607 are antisense polynucleotides targeted to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense compound useful for diagnosis, treatment and prevention of disease associated with ELK-1 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
                                                                                                                                                                                                                                                                                                                                                              The invention relates to KVLQT1 and KCNEI genes, associated with long QT (LQT) syndrome. It provides a minK protein comprising a mutation which substitutes the wild type amino acids with Leu, ABp, Leu, His, Trp and Ala or Thr at residues 74,76,28,32,98 and 127 respectively. Screening KVLQT1 and KCNEI is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. Sequences AZS90707-Z90740 represent PCR primers for amplifying human KVLQT1 exons
                                                                                                                                                                                                                  Mutant forms of genes encoding mink protein and KVLQT1 protein involved in cardiac potassium channel formation useful for screening drugs, for preventing and treating cardiac arrhythmia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; CD40; antisense oligonucleotide; phosphorothioate; modulation; expression; immune disease; inflammatory disease; immuneodulatory; anti-inflammatory; anti-asthmatic; antiproliferative; anti-asthmatic; antiproliferative; anticancer; immuno-suppressive; anti-psoriaritic; allograft rejection; hyperproliferative disease; autoimmune disease; rheumatorid arthritis; inflammatory bowel disease; asthma; psoriasis; cancer; tumour; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense molecules directed against nucleic acid encoding human CD40, for treating e.g. immune, inflammatory or hyperproliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states.
                                                                              expression of human CD40; which can be used to inhibit the expression of human CD40; which can be used to inhibit the tumour growth and/or angiogenesis. Inhibition of CD40 is used to treat or prevent immune-associated diseases (specifically guest vs. host disease, allograft rejection or autoimmune diseases); inflammation (specifically asthma, rheumatoid arthritis, allograft rejection, inflammatory bowel disease or psoriasis) or hyperproliferation (specifically cancer and rumours). the antisense oligonucleotides are also useful as diagnostic and research reagents. AAZ47776 represents the human CD40 nucleotide sequence. AAZ47770 to AAZ47772 represent human CD40 forward and reverse PCR primers, and a human CD40 forward and reverse AAZ47775 to the control of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel biallelic markers used to construct a high density disequilibrium map of the human genome.

Chumakov I; Blumenfeld M, (GEST ) GENSET Cohen D, Novel biallelic markers used to construct a high density disequilibrium

WPI; 2000-013267/01

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

The invention relates to KVLQT1 uncleic acids which have a mutation compared to wild-type KVLQT1 (AA298901) The KVLQT1 gene encodes a protein compared to wild-type KVLQT1 (AA298901) The KVLQT1 gene encodes a protein of 676 amino acids which forms a cardiac I(ks) potassium channel with the KVRNEI protein (AAY80653). The KVLQT1 gene contains 15 introns and encodes a protein containing 6 putative transmembrane segments and a pore forming region. The gene has been mapped to the chromosomal location 11p15.5. The sequences AA298913-Z39870 represent primers used to PCR amplify the KVLQT1 exon sequences. Mutations in the KVLQT1 or KCNEI genes result in cardiac arrhythmias observed as prolonged QT curve in electrocardiograms (Long QT syndrome). The genes and proteins can be used for the diagnosis of subjects with long QT syndrome. They can also be used to screen for drugs which can be used for treating or preventing long QT syndrome. The KVLQT1 nucleic acids can be used for gene therapy, and KVLQT1 peptides can be used for peptide therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated mutant KVLQT1 nucleic acids, useful for developing products for the diagnosis, prevention and treatment of long QT syndrome.

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                 Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human spenes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                               The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                           Nucleic acid selected from one of 106 genes comprising single nucleotide

LITE INVENTION LITERALES TO BE INDICATED COMPILIES.

SEQUENCE Which encodes an insect histone acetyltransferase (HAT a member of the MYST family which regulates food uptake) and is either the Cof the MYST family which regulates food uptake) and is either the coff so the MYST family which regulates food uptake) and is either the acids, a cukaryotic cell harbouring the vector comprising the nucleic acids, a cukaryotic cell harbouring the vector or nucleic acids and an assay for detecting inhibitor molecules that have an effect on the competing in presence of suitable substrate, buffer and assay conditions.

The vector is useful for the recombinant production of ROT. ROT is useful cor the biochemical or structural characterisation of the potential inhibitors of the encoded protein. The inhibitor, in appropriate chemical compositions, is useful for an insect controlling method based on specific inhibition or sufficient reduction of activity of the native carget protein (Rockeholden (ROT) protein which is a HAT that belongs to the so called MYST family of HAT) in an insect. ROT protein is useful as compositions.

Character protein in a presence of suitable substrate agrochemistry, veterinary and pharmaceutical applications. The present sequence is a PCR primer used to
                                                                                                                                                                                                                                                                                           ó
KVLQT1 is a cardiac potassium channel and mutations in the KVLQT1 gene cause Jervell and Lange-Nielsen Syndrome (JLN). KVLQT1 maps to chromosome [1p15.5. The present invention relates to a mutant KVLQT1 coding sequence (see AAC89914). The mutant KYLQT1 coding sequence is useful in the diagnosis of long OT syndrome and in screening humans for the presence of KVLQT1 gene variants which cause JLN syndrome. The present sequence is a PCR primer used to amplify a KVLQT1 exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated DNA molecule comprising a DNA sequence which encodes an insect histone acetyltransferase (HAT a member

The present invention relates to the isolation of the Streptomyces atroolivaceus leinamycin (Inm) biosynthesis gene cluster containing 71 open reading frames (ORFs) (ORFs -15 through -1, ORFs lnmA through lnmZ, and ORFs +1 through +9). Leinamycin is a novel anti-tumour antibiotic conditions antimicrobial activity against Gram-positive and Gram-negative bacteria, but not against fungi. The polypeptides encoded by the Lnm biosynthesis gene cluster ORFs are useful for chemically modifying a molecule in a host cell. The host cell is a bacterium or eukaryotic cell, including a mammalian, yeast, plant, fungal, or insect cell. The molecule in a namedian, yeast, plant, fungal, or insect cell. The molecule is an endogenous metabolite produced by the host cell or exogenously supplied metabolite, or an amino acid, and the polypeptide is a peptide synthetase or amino transferase. The polypeptides encoded by the Lnm gene cluster correcting an apo-carrier protein to a holo-carrier protein. Lnm shows potent antitumour activity in tumour models in vivo. The Lnm gene cluster modules and/or polyketide, and/or hybrid metabolites. The proteinis are useful for making various peptide metabolites. The proteins encoded by the ORFs are useful alone, or in combination with other active domains to modify various target substrates. The Lnm gene cluster is useful to upregulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Leinamycin biosynthesis gene cluster; Lmn; open reading frame; ORF; anti-tumour antibiotic; broad spectrum antimicrobial activity; dram-negative bacteria; chemical modification; metabolite; apo-carrier protein; holo-carrier protein; tumour; polyketide; hybrid polypeptide/polyketide metabolite; Lnm production; cytostatic;

The present invention relates to a method (M1) for determining a predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from UPA (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulindegrading enzyme), KNSLI (Kinesin-like protein I), IDPA (lysosomal acid lypase), and INPRSF6 (Tumour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the
                                                                                                                                                                                           0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic
endogenous Inm production to permit Inm production in cells and/or to make various modified Inm. Inm, its analogue, or other polyketide, peptide or hybrid polyketide/peptide metabolites are useful as therapeutic agents, to treat a number of disorders, depending upon the type of metabolites. ABX34290-ABX34431 represent PCR primers used to amplify individual ORFs of the S. atroolivaceus leinamycin biosynthesis

The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from upA more polymorphic regions of one or more genes selected from upA (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulindegrading enzyme), RNSIA (Kinesin-like protein 1), LIPA (lysosomal acid lypase), and INFRSFG (Tumour Neorosis Factor Receptor-SFG), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the occurrence of neurodegenerative disease. The genes are all located on chromosome 10. M1 is useful for determining a predisposition for or the
occurrence of neurodegenerative disease. The genes are all located on chromosome 10. M1 is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly Alzheimer's disease. The present sequence is a PCR primer, which was used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bertram L;

Oligonuclectide probes that hybridise to the CDNA sequence are useful for analysing the expression of FCH11 by detecting the expression of the mRNA transcript in the sample. A host cell transformed with the CDNA of the invention is useful for producing the protein by recombinant means. Pharmaceutical compositions based on the sequences of the invention are expression of FCH11 such as familial combined hyperlipidaemia, coronary artery disease, atherogenic lipoprotein phenotype,
occurrence of, and for treating neurodegenerative disease, particularly Alzheimer's disease. The present sequence is a PCR primer, which was used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               hyperapobetalipoproteinaemia, hypertriglyceridaemia, familial systance and syslipidaemic hypertension, syndrome X, obesity, insulin resistance and hypercholesterolaemia. The cDNA sequence is useful in the diagnosis or prognosis of predisposition to lipid disorders and cancers, and also to identify a molecule which enhances or decreases the HYPLIP1 or FCHII activity. The present sequence represents an oligonucleotide primer specific for the mouse HYPLIP1 locus of the invention. The mouse HYPLIP1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mouse; primer; antilipaemic; cardiant; hypotensive; anorectic; HYPLIPI; FCHLI; lipid disorder; familial combined hyperlipidaemia; coronary artery disease; atherogenic lipoprotein phenotype; cancer; hyperapobetalipoproteinaemia; hypertriglyceridaemia; obesity; ss; familial dyslipidaemic hypertension; syndrome X; insulin resistance; hypercholesterolaemia; chromosome 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel HYPLIP1 and FCHL1 genes and their sequence variations associated with lipid disorder and cancer, useful for prognosis, diagnosis and

The FCHL1 polyncleotide, the FCHL1 polypeptide or antibody immunoreactive to the FCHL1 polypeptide are useful for treating or preventing cancer associated with expression of FCHL1, as well as for treating lipid disorder. The mouse HYPL1P1 CDNA or human FCHL1 gene are also useful for diagnosing or prognosing a predisposition to lipid disorder. ABK70902-ABK71303 represent mouse HYPLIP1, human

```
The invention discloses isolated polynucleotides comprising mouse HYPLIP1 CDNA sequence, mouse HYPLIP1 genomic DNA, or the homologous human cambrined hyperlipidaemia 1 (FCHL1) gene, where a variation in the sequence is associated with a lipid disorder. Also claimed is an isolated polypeptide comprising a variant form of the mouse HYPLIP1 amino acid sequence, or a variant form of a fully defined human FCHL1 amino acid sequence, where the variant is associated with the lipid disorder. In isolated polynucleotide having at least 12 contiguous nucleotides of the isolated polynucleotides, where the 12 contiguous nucleotides span the variation position, an isolated polypeptides, where the 4 contiguous amino acids of the encode polypeptides, where the 4 contiguous amino acids of the encode polypeptides, where the 4 contiguous amino acids of the conderises comparing the nucleotide sequence of the suspected FCHL1 allele with a wild-type FCHL1 nucleotide sequence, where the difference between the suspected allele and the wild-type sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated polynucleotide comprising a mouse or human familial combined hyperlipidemia I gene having a variation that is associated with a lipid disorder, useful for identifying susceptibility to the lipid disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            identifies a sequence variation of FCHLI nucleotide sequence and a pharmaceutical composition. Also disclosed is a transgenic animal which carries an alterated HYPLIPI or FCHLI allelle and a method for screening drugs for inhibition or restoration of FCHLI gene function as an antilipid disorder or anti-cancer therapy. The polynucleotides, polypeptides and antibodies are useful for treating or preventing (e.g. gene therapy) a lipid disorder associated with expression of FCHLI, for diagnosis or prognosis of predisposition to lipid disorder, and cancer and for treating a lipid disorder such as familial combined hyperlipidaemia,
                                                                                                                                     allele, anti-lipid disorder; anti-cancer therapy; gene therapy; familial combined hyperlipidaemia; coronary artery disease; atherogenic lipoprotein phenotype; hyperapobetalipoproteinaemia; hyperriglyceridaemia; low density lipoprotein subclass B; LDL; familial dyslipidemic hypertension; syndrome X; hypercholesterolaemia; obesity; insulin resistance; cancer; cytostatic; antilipaemic; hypotensive; anorectic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes an isolated polypeptide (I) comprising a variant form of a mouse HYPLIPI polypeptide sequence (SI) or a human FCHLI polypeptide sequence (SI) or a human FCHLI polypeptide sequence (SI) or a human FCHLI variant form is associated with cancer, or an amino acid sequence having at least 65 % sequence identify to (SI) or (S2). A composition comprising DNA encoding (I) is useful for treating or preventing cancer associated with expression of FCHLI, FCHLI gene or HYPLIPI gene and its product are identify other genes, receptors and relationships that contribute to identify other genes, receptors and relationships that contribute to lipid disorder and cancer. FCHLI gene or its fragments are useful in gene therapy to increase the amount of the expression products of the gene for
hyperapobetalipoproteinaemia, hypertriglyceridaemia, low density hyperapobetalipoproteinaemia, hypertriglyceridaemia, low density hyportenein (IDI) subclass B, familial dyslipidemic hypertension, syndrome X, hypercholesterolaemia, obesity, insulin resistance and cancer. The sequence presented is a PCR primer which was used to amplify part of the mouse HYPLIP1 locus.
                                                                                                                                                                                                                                                                                                                                                                                                                               cytostatic; antilipemic; gene therapy; peptide therapy; HYPLIPI; FCHLI; cancer; metabolic pathway; cellular mechanism; lipid disorder; familial combined hyperlipidaemia; mouse; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and merabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
the treatment of lipid disorder or cancerous cells. The sequence variation of FCHL1 gene or HYPL1P1 gene is also useful in the diagnosis and prognosis of predisposition to lipid disorder and cancer. Antisense polymucleotide sequences reselul in preventing or diminishing the expression of HYPL1P1 or FCHL1 locus. This sequence represents a primer used in the analysis of the mouse HYPL1P1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           بر

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           olek A,
     This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting call type differentiation. ABC0010-ABC99989, ABF00010-ABF99899, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but
                                                                                                                                                                                                                                                                                                                                                                                                                SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Arthritic condition; graft tolerance; immune response; target; cleavage; hammerhead ribozyme; hairpin ribozyme; human; rabbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis; rheumatoid arthritis; autoimmune disease; allergy; inflammation;
                                                                                                        This 5' PCR primer was used with a 3' primer designated a constant region sequence common to all TCR beta transcripts. It was used for the PCR analysis of lower TCR usage in synovial Vbetas. This primer was used for Vbeta family 9, subfamily 91, Ubeta 2.3, Cbeta 2 and corresponds to D & J translation AAR34166. (Updated on 25-MAR-2003 to correct PW field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic nucleic acid molecules having a hammer-head motif - used for
the treatment of arthritis, induction of graft tolerance or treatment of
treatment of auto-immune disorders, partic. rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Stinchcomb DT, Jarvis T, Draper K, Pavco P;

                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and methololic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   T-cell receptor antagonising polypeptide(s) - used in the diagnosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR primer #12 for analysis of lower TCR Vbeta gene usage in RA SILs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TCR; T cell receptor; autoimmune disease; rheumatoid arthritis; RA; J beta domain; V beta domain; T-cell mediated autoimmune disease;
                                                                                                                                                                                                                                                 Set of oligonuclectides, useful for diagnosis and cell typing, i designed to detect single-nuclectide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .
